                                                                                                                                                                                                                                                                                                                                                                                        * NOTE: This is a 'working draft' sequence. It currently a consists of 35 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * tuns of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 contig of 1551 bp in length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rate <= 1/10.
* NOTE: This is a 'working draft' sequence. It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 21; DB 20; Length 162815;

E 2 (bases 1 to 2167)

The genomic locus of the human hemopoletic specific cell protein
tyrosine kinase (PTK)-encoding gene (HCK) confirms conservation of
exon-intron structure among human PTKs of the src family

Gene 113 (2), 275-280 (1992)

present sequence encodes human SAD. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPS) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the

                                                                   New nucleic acid encoding specific protein tyrosine phosphatases -

"seful for identifying specific modulators for treatment and

"prevention of Cancer and neurodegenerative disease

"prevention of Cancer and neurodegenerative disease

"Example 6; Page 87; 193pp; English;

The present invention describes isolated, enriched or purified nucleic

acids encoding PPPO4, SAD, PPPO5, PPTO10, ALD and ALK-7 proteins. The

acids encoding PPPO4, SAD, PPPO5, PPTO10, ALD and ALK-7 proteins. The

acids encoding PPPO4, SAD, PPPO5, PPTO10, ALD and ALK-7 proteins. The

acids encoding PPO4, SAD, PPPO5, PPTO10, ALD and ALK-7 proteins. The

acids encoding PPPO4, SAD, PPPO5, PPTO10, ALD and ALK-7 proteins. The

acids and antaqonists, including NBP) in vivo or in vitro.

These substances are used to treat or prevent diseases associated with

abnormal signal transduction pathways that involve the proteins,

particularly cancer (e.g. leukaemia and lymphoma), while modulators of

ALK-7 (which is a type i receptor serine/threonine kinase) are used to

promote neuronal survival, particularly for treating Alzheimer's,

Parkinson's or Huntington's diseases. Nucleic acid fragments of the

polymuclectides encoding the proteins can be used as probes. Lo. identify

and clone related sequences; to detect protein-encoded RNA; to generate

transgenic animals and in gene therapy (optionally after mutation). Ab

are account of the proteins. The present sequence represents a

polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the proteins. The present sequence represents a PCR primer for human SAD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          transgenic animals and in gene therapy (optionally after mutation).                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SaD, PTP05, PTP10, ALP and ALK-7 proteins. The acids encoding PTP04, SaD, PTP05, PTP10, ALP and ALK-7 proteins. The above proteins, other than ALK-7, are protein tyrosine phosphatases.

(i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to parkinson's or Huntington's diseases. Nucleic acid fragments of the polymoulectides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). A continuation of the proteins. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention describes isolated, enriched or purified nucleic acids encoding PPP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The acids encoding PPP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The above proteins, other than ALK-7, are protein tyrosine phosphatuses.

CPTPS) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with particularly cancer (e.g. leukaemia and lymphoma), while modulators of articularly cancer (e.g. leukaemia and lymphoma), while modulators of particularly cancer (e.g. leukaemia and lymphoma), while modulators of particularly cancer (e.g. leukaemia and lymphoma), while modulators of promote neuronal survival, particularly for treating Alzheimer's, parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). A contraction of the present sequence represents a proper contraction of the present sequence represents and the proteins. The present sequence represents and the proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          read nucleic acid encoding specific protein tyrosine phosphatases restinging the control of cancer and neurodegenerative disease.

New nucleic acid, and acid encoding specific protein tyrosine phosphatases - useful for identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease.

They are seen invention describes isolated, enriched or purified nucleic acids encoding PTPD4, SAD, PTPD6, PTPD7, AD and ALK-7 proteins. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPS) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of the promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polymore can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Above the proteins can be used to determine the proteins. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          10-MAR-1999 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the proteins. The present sequence represents a PCR primer for human SAD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       10-MAR-1999 (first entry)

Human SAD PCR primer 6645.

Human SAD PCR primer 6645.

PTP04, PTP05, PTP10, SAD: ALP; ALK-7; protein tyrosine phosphatase; type I receptor serine/threonine kinase; cancer: leukaemia; lymphoma; neurodegenerative disease, neuronal survival; Alzheimer's disease; Parkinson's disease; Huntington's disease; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                               Cb
                                                      Natively D. Onlines S., Peles E., Plowman GD;

New nucleic acid encoding specific protein tyrosine phosphatases -
reset is dentifying specific modulators for treatment and
reset is cancer and neurodegenerative disease

Example 6: Page 87: 193pp: English.

Example 6: Page 87: 193pp: English.

The present invention describes isolated, enriched or purified nucleic
above proteins, other than ALK-7, are protein tyrosine phosphatases.

The present invention describes isolated, enriched or purified nucleic
above proteins, other than ALK-7, are protein tyrosine phosphatases.

(i.e. agonists and antagonists, including NBP) in vivo or in vitro.

These substances are used to treat or prevent diseases associated with
abnormal signal transduction pathways that involve the proteins,
controllarly cancer (e.g. leukaemia and lymphoma), while modulators of
ALK-7 (which is a type I receptor serine/threonine kinase) are used to
promote neuronal survival, particularly for treating Alzheimer's,
concernment and ingene proteins can be used as probes to identify
and clone related sequences; to detect protein-encoded RMR; to generate
transgenic animals and in gene therapy (optionally after mutation). Ab
are used to determine the proteins. The present sequence represents a
conserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The above proteins, other than ALK-7, are protein tyrosine phosphases (PTPs) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10-MAR.1999 (first entry)

promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the proteins. The present sequence represents a RACE primer for human SAD.

                                                                                                                                                                                                                                               Tricancer composition comprising two anti-sense oligo:nucleotide(s)

Tricancer composition comprising two anti-sense oligo:nucleotide(s)

Tricancer composition and nuclear oncogene(s)

Claim 105-106; 92pp; English.

The present sequence represents an oncogene from the present invention.

The present invention describes a composition which comprises two antisense oligonucleotides. The first oligonucleotide is specific for a cytoplasmic oncogene or proto-oncogene selected from ras, raf, EGF-1, c-fms, c-ros, c-kit, c-met, c-trk, c-src, c-abl, bcr-abl, c-fgr and cytoplasmic oncogene selected from myc, jun, c-ets, c-fos, c-myb, B-myb, c-rel, c-vav, c-ski, c-spi, cyclin Dl, pML/RAR alpha , AMLI/MT68, E2A/pr1 and ALL-1/AF-4. The composition is used for treating cancer. The combination of antisense oligonucleotides has synergistically enhanced ability to inhibit growth of cancer cells.

Example 2; Page 30; 54pp; English.

Sequences V69551 to V6964 represent PCR primers used for localisation of the genes of the invention which occur on the non-recombining region of the human Y chromosome. The gene sequences fall into two classes: (1) X-homologous DNA which are expressed in many organs, having functional X-homologous and (2) testis-specific DNA sequences. Y chromosomal DNA from males with known conditions such as infertility and reduced sperm count can be assessed using the invention to determine whether the condition is associated with or caused by the occurrence of the gene or gene alteration. Candidate inhibitors of the enzymatic activity of the

Plasmid DNA from the normalized library NCI_CGAP_Kid3 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (CloneIDs 1323376-1323911, 1456007-1456775, and 1500552-1502855). Subtraction by Bento Soares and M.

individually tagged normalized libraries constructed from $1.2$ and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-draw which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-CI) was constructed as follows: PCR amplified cDNA inserts from UI-R-CO clones from which 3' ESTS had been derived was used as a driver in a hybridization with the UI-R-CO library in the form of single-stranded circles. The remaining single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia; Butheria; Primates; Catarrhini; Hominidae; Homo.

/note=Vector: pT/T3D-Pac (Pharmacia) with a modified
polylinker; Site_1: Not 1; Site_2: Eco R1; The UI-R-C1
library is a subtracted library derived from the UI-R-C1
library, which is a subtracted library derived from the
UI-R-Al and UI-R-E1 libraries: The UI-R-Al library
consisted of a mixture of individually tagged normalized
libraries constructed from rat placenta, adult lung,
brain, liver, kidney, heart, spleen, ovary, and muscle.
The UI-R-E1 library consisted of a mixture of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;

Notes "Vergue Dawles"

Notes "Vector: pT73D-Pac (Pharmacia) with a modified polylinker; Site_I: Not I; Site_2: Eco RI; The UI-R-CI library is a subtracted library derived from the UI-R-CI library which is a subtracted library derived from the UI-R-CI library, which is a subtracted library derived from the UI-R-CI library do II library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, and muscle. The UI-R-EI library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, and muscle. The UI-R-EI library consisted of a mixture of individually tagged normalized libraries constructed from 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligorial rate which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-CI) was constructed as follows: PCR amplified cDNA inserts from UI-R-CO clones from which ESTS had been derived was used as a driver in a hybridization with the UI-R-CO library in the form of single-stranded circles. The remaining single-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-CI library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806, 1996).
